Tempered Hardboard Skin

Performance

High Strength
Hardboard is a stiff wood by compositional quality which contributes to its ability to rigidly hold form over time. The skin is tempered to further strengthen its structure against direct impact.

Moisture Resistant
The materials hosts similar moisture-resistant properties to Plywood that make it suitable for application in wet areas like bathrooms.

Smooth Surface
The smooth grain of its surface delivers a similarly smooth finish to MDF. Its aesthetic uniformity makes it suitable for application in common areas with wide visibility and high interior design standards.

High Density
Tempered Hardboard is a high-density material as it is engineered as a compact wood. This density makes for excellent insulation for acoustics (minimising the transfer of sound between rooms) and climate (minimising the transfer of cool/heat between rooms).

Rating

Fire-Rated: 3.2mm Tempered Hardboard is compliance for application to particular configurations of Spence Doors fire-rated doorsets.

Finish

As a small-grain engineered wood, the surface finish of MDF is very smooth and consistent throughout the substrate. This makes for an aesthetically pleasing finish for doors where interior design is key. An added benefit of this smooth surface is its easy acceptance of paint relative to the alternatives likes Ply.
